

Circuit description

Electrical switch is battery and chip supply channels, there would be no electricity supply.

After turn off the battery supply voltage and current to the bluetooth chip, chip supply within other modules, at the same time supply external internal storage. External crystals (16 MHZ) to provide needed chip clock. Bluetooth communication process data stored in the memory. External key part is the I/O matrix. After FPC seat, it can have up to 18* 8 key. All of the data processing is done by bluetooth chip.
